Qwen

From Monopoly to Market: Modernizing Bangladesh's Fertilizer Subsidy System for Sustainability and Equity

The Existing Framework: Structure, Actors, and Flows

Bangladesh's fertilizer import and distribution system represents a large-scale, vertically integrated operation that is deeply embedded in the nation's agricultural economy and food security strategy [8]. Annually, the country expends approximately $15 billion on importing fertilizers and other essential food items, underscoring the criticality of this sector [14]. The system is characterized by a top-down structure dominated by state-owned entities, which manage everything from importation and procurement to wholesale and retail distribution. The central authority for policy and planning resides with the Ministry of Agriculture (MoA), which has historically overseen numerous agricultural development projects, often with financial support from international bodies like the World Bank [116][187]. This ministry sets the strategic direction, including demand projections, which for FY 2025–2026 forecasted a staggering demand of over 6 million metric tons of fertilizers [16].

The operational backbone of the distribution network has traditionally been the Bangladesh Agricultural Development Corporation (BADC), a state parastatal entity that has long held a near-monopolistic position in the market [116][193]. The BADC is responsible for purchasing fertilizers, managing storage facilities, and distributing them through a hierarchical network of dealers and sub-dealers who extend the reach into rural farming communities [331]. This centralized model, while designed for control and nationwide coverage, creates significant bottlenecks and limits the participation of the private sector in the distribution chain [273]. The reliance on physical documentation, such as "Distribution Cards" and "Fertilizer Distribution Registers," has been a hallmark of the system, indicating a low level of digital integration and data management [193]. The process for Nepal to import fertilizers from Bangladesh within mid-January 2021 highlights the existence of inter-state trade mechanisms, but the domestic flow remains firmly under state control [201].

Beneficiary identification within this framework has been a persistent weakness. Historically, there has been no robust, centralized, and verifiable database of farmers, making precise targeting extremely difficult [43]. Targeting has often relied on broad geographic criteria or informal lists, which inevitably leads to significant inclusion and exclusion errors [101][175]. The lack of a formal registration system means that the benefits of the subsidy, which are theoretically intended for smallholder farmers, frequently leak out to non-poor individuals, wealthier landowners, and even non-farmers [274]. While plans for a national Farmer ID system, known as the "Krishak Card," have been announced with a target of issuing 22 million cards by 2028, the full implementation of such a foundational infrastructure is still pending [43][115]. Without this digital identity layer, any attempt at accurate targeting remains compromised.

The mechanism for subsidy disbursement is one of direct input provision, where the government subsidizes the cost of production and importation, allowing state entities like the BADC to sell fertilizers to farmers at prices significantly below the world market rate [189][325]. This approach effectively embeds the subsidy into the final product price, ensuring affordability for farmers. However, it also distorts market signals, discourages efficiency among producers, and places a substantial and growing burden on public finances [58]. In recent years, the government has begun to adopt a more market-based pricing formula for some inputs, but the overarching principle of heavy state support remains [48][58]. This traditional model, reliant on state monopolies and price controls, stands in contrast to emerging global trends favoring market-based instruments, digital vouchers, and repurposed support aimed at promoting sustainability [70][215]. The system's reliance on physical documents and manual processes further exacerbates inefficiencies and opportunities for corruption throughout the supply chain [193][202].

Core Challenges: Inefficiency, Equity, and Environmental Degradation

Despite its scale and importance, Bangladesh's fertilizer subsidy system is beset by a confluence of severe challenges that undermine its effectiveness, equity, and long-term sustainability. These issues span economic, social, and environmental domains, creating a multi-faceted crisis that necessitates fundamental reform. The system is described as having "limited effectiveness" despite being the largest single item of social expenditure, with program costs showing a consistent upward trend [86]. This fiscal strain is a primary driver for change, as the government faces immense pressure to contain spending on

subsidies—alongside food and fuel—as part of broader macroeconomic stabilization efforts [44] [48] [51]. The annual subsidy program, estimated at around US$1.1 billion in 2017–18, represents a significant portion of GDP, diverting resources from other critical areas like public investment [12] [173]. Global shocks, such as the sharp price increases in global fertilizer markets during 2021 and 2022, have further complicated policy-making and placed additional stress on an already strained budget [81] [242].

A critical failure lies in the system's inability to accurately target its intended beneficiaries. Evidence consistently points to significant targeting failures and widespread subsidy leakage [274]. Because the system lacks a reliable, centralized registry of farmers, subsidized inputs often reach non-poor households, commercial farms, and even ineligible individuals, rather than the smallholder farmers they are meant to assist [175][274]. This inequity not only wastes scarce public funds but also fails to achieve the core objective of poverty alleviation and support for the most vulnerable segments of the agricultural population [324]. Simulations indicate that while perfect targeting is an unrealistic goal, the current system's performance is demonstrably poor when compared to potential alternatives [63] [103]. Comparative studies from other developing nations, such as Ghana and Malawi, highlight similar persistent problems, reinforcing the notion that weak targeting is a systemic issue that transcends borders but requires context-specific solutions [26] [77] [192].

Beyond economic and equity concerns, the current subsidy regime has precipitated severe environmental degradation. The policy has heavily favored nitrogenous fertilizers, leading to unbalanced nutrient application and a decline in soil health [21] [123]. This over-reliance contributes to soil degradation and groundwater contamination with nitrates, posing long-term risks to both agricultural productivity and human health [53] [88]. Furthermore, the inefficient use of these inputs results in low Nitrogen Use Efficiency (NUE), meaning a significant portion of applied fertilizer is lost to the environment rather than being utilized by crops [129]. These outcomes run counter to the principles of sustainable agriculture and contribute to greenhouse gas emissions, specifically ammonia and nitrous oxide [129]. The negative externalities associated with the current policy framework highlight a critical disconnect between agricultural support policies and environmental protection goals, calling for a more integrated and coherent approach to governance [68] [88]. The system's failure to align with the objectives of frameworks like the International Code of Conduct for the Sustainable Use and Management of Fertilizers further underscores its misalignment with global best practices [76] [151].

Finally, the logistical and operational aspects of the supply chain are fraught with frictions that reduce overall system efficiency. The journey of fertilizer from port to farm is often delayed due to inadequate handling, transportation bottlenecks, and insufficient warehousing capacity [164][167]. A lack of information technology (IT) integration across the logistics sector results in very little supply chain visibility, making it difficult to track shipments in real-time, manage inventory levels, and respond to disruptions [133][321]. This opacity complicates oversight and allows for inefficiencies to persist undetected. Moreover, Bangladesh's unique geography, with its extensive river network, presents distinct challenges for transport connectivity and logistics management, further compounding the difficulties of ensuring timely and efficient distribution to remote farming areas [267]. These logistical shortcomings not only increase the cost of the subsidy program but also risk creating shortages and price volatility at the local level, undermining the stability it is intended to provide.

Digital Transformation Pathway: The E-Voucher Model

In response to the profound inefficiencies and inequities of the existing system, Bangladesh is actively exploring a pathway to reform centered on digital transformation, with the e-voucher model emerging as a cornerstone of this new strategy. This approach represents a paradigm shift away from the government's direct provision of subsidized inputs towards a more market-oriented mechanism that empowers farmers while enhancing transparency and accountability. The core concept of the e-voucher system is to decouple the government's subsidy disbursement function from the cumbersome and often corruptive tasks of procurement, storage, and physical distribution [30][273]. Instead of receiving free bags of fertilizer from state-run depots, eligible farmers would be issued electronic vouchers through a digital platform [135]. These vouchers, linked to a verified farmer identity, could then be redeemed by the farmers themselves at a network of pre-approved private dealers to purchase the specific inputs they require [32][113]. This model directly addresses many of the systemic flaws of the current framework.

Bangladesh has already initiated practical steps toward adopting this model. A pilot project was launched to test the e-voucher system for providing potassium fertilizer subsidies, utilizing a newly developed digital infrastructure [135]. This initiative is part of a broader World Bank-supported program that includes the establishment of a digital agriculture information management system, signaling a clear commitment to building the technological foundation for a modernized subsidy program [39]. The feedback

gathered from a series of consultations involving farmers, dealers, and sub-dealers participating in the pilot provided valuable insights into the practical challenges and opportunities of implementation [331]. The World Bank's involvement in evaluating the pilot's impact through third-party verification further underscores the emphasis on generating rigorous evidence to guide future scaling [20] [253].

This digital approach is not an experimental leap for Bangladesh; it is grounded in a growing body of international experience demonstrating the viability and benefits of such systems, particularly in Africa and Asia. Malawi, for instance, launched its electronic Government Procurement (e-GP) system in 2019 specifically to improve the transparency and efficiency of its agricultural input subsidy program [141]. Similarly, Ghana has moved to repurpose its fertilizer subsidy program, introducing a new phase (PFJ 2.0) that builds on lessons learned from previous initiatives and incorporates more targeted approaches [172]. In India, the Direct Benefit Transfer (DBT) scheme has become a flagship program for transferring welfare payments, including subsidies, directly into the bank accounts of beneficiaries, drastically reducing leakages and intermediary involvement [155][159]. Research has shown that phone-based targeting methods used in such programs can reduce exclusion errors by a significant margin compared to traditional geographic targeting [101]. The global consensus, supported by institutions like the Food and Agriculture Organization (FAO), points towards the adoption of voucher and e-voucher modalities as a superior strategy for delivering agricultural inputs to those who need them most [30] [137]. By embracing this proven model, Bangladesh aims to create a more competitive and dynamic private distribution sector, increase accountability, and ultimately deliver subsidies more effectively to the smallholder farmers who form the backbone of its agricultural economy [29] [178].

Repurposing Support for Sustainable Food Systems

Beyond simply changing the delivery mechanism, a crucial dimension of reform involves the strategic repurposing of fertilizer subsidies to align with broader national and global goals for sustainable development, climate resilience, and improved nutrition. This represents a move away from viewing subsidies merely as a tool for input price reduction towards seeing them as an instrument for incentivizing better agricultural practices. The current system's heavy bias towards nitrogenous fertilizers has led to imbalanced nutrient use, soil degradation, and environmental harm, highlighting the need for a more nuanced approach [21] [53]. Repurposing support offers a pathway to correct these distortions and

build a more sustainable long-term foundation for agriculture. One of the most immediate and impactful strategies is to shift subsidies from supporting the consumption of nitrogen-only fertilizers to promoting balanced NPK (Nitrogen-Phosphorus-Potassium) blends [129]. This would directly address the issue of nutrient imbalance in soils, which is a well-documented consequence of the current policy [123]. By making balanced fertilizers more affordable and accessible, the government can encourage practices that improve soil fertility, enhance crop yields sustainably, and reduce the negative environmental externalities associated with excessive nitrogen application [52].

This shift towards sustainability extends to addressing the pressing challenge of climate change. Subsidy funds can be redirected to support the adoption of Climate-Smart Agriculture (CSA) practices that improve resource efficiency and build resilience. A key area for intervention is improving Nitrogen Use Efficiency (NUE), which can be achieved through the adoption of the "4R nutrient stewardship" framework: applying the right source of nutrients, at the right rate, at the right time, and in the right place [129]. Supporting the dissemination of knowledge about these practices, potentially through the agricultural extension system, can help farmers get greater returns from their fertilizer investments and reduce harmful emissions of ammonia and nitrous oxide [71] [129]. This aligns perfectly with global efforts to make food systems more resilient and environmentally friendly, as advocated by bodies like the World Bank and FAO [215][217]. By framing subsidies not just as a handout but as an investment in sustainable production, the government can foster innovation and long-term productivity gains.

Furthermore, the repurposing agenda seeks to integrate agricultural support more coherently with other sectors, particularly water and environmental management. The current fertilizer policy is often implemented without sufficient coordination with agencies responsible for water resources, leading to unintended consequences like groundwater contamination [88]. A more integrated approach would require stronger inter-ministerial coordination to ensure that agricultural policies do not undermine environmental protection goals [68]. This involves developing a regulatory framework that promotes the sustainable use of all agricultural inputs, including fertilizers and pesticides, and supports capacity-building for farmers and officials alike [68] [151]. Aligning with the International Code of Conduct for the Sustainable Use and Management of Fertilizers provides a globally recognized framework for guiding this transition [76] [117]. Ultimately, repurposing subsidies is about transforming the system from one focused on quantity (maximizing input use) to one focused on quality and sustainability (promoting efficient and environmentally sound practices). This requires a long-term vision and sustained political will, but it holds the promise of building a more resilient, equitable, and productive agricultural sector for Bangladesh.

Institutional Overhaul and Policy Coherence

Achieving meaningful reform in Bangladesh's fertilizer system requires more than just a change in subsidy delivery mechanisms; it necessitates a comprehensive overhaul of the underlying institutional structures and a concerted effort to ensure policy coherence across different government sectors. There is a widely acknowledged need to strengthen institutions, improve governance, and enhance the technical capacity of the agricultural sector to manage complex supply chains and implement sophisticated subsidy programs [3] [4]. This includes investing in accurate and timely statistics, which are the bedrock of sound policy design and effective monitoring [285]. Without reliable data on farmer demographics, landholding sizes, input usage patterns, and yield outcomes, any targeting mechanism will remain flawed, and it will be impossible to rigorously evaluate the impact of reforms [245]. The government's initiative to establish SDG Trackers with disaggregated data is a step in the right direction, but more targeted investment in agricultural data systems is required [280].

At the heart of any modernized system is the creation of a robust, unified, and verifiable national farmer database. The proposed "Krishak Card" or Farmer ID is not merely a convenience but a foundational piece of digital infrastructure upon which all other reforms depend [43] [115]. A nationwide rollout of this biometrically secured database would enable precise targeting of subsidies, eliminating ghost beneficiaries and ensuring that aid reaches the intended smallholder farmers [115]. It would streamline administrative processes, reduce transaction costs, and provide a single point of entry for linking farmers to a multitude of government services beyond just fertilizer subsidies, including credit, insurance, and extension advice [43]. The successful implementation of such a system in Punjab, India, which enabled the effective targeting of over 4 million farmers through e-vouchers, serves as a powerful precedent for what is possible [316]. For Bangladesh, fast-tracking the development and nationwide deployment of the Krishak Card is a prerequisite for successfully transitioning to a more efficient and transparent e-voucher-based system.

Policy coherence is another critical pillar of institutional reform. Currently, agricultural policies related to fertilizer subsidies are often developed in silos, without adequate consultation with ministries responsible for environment, water resources, and public health [88]. This lack of coordination can lead to conflicting objectives and unintended negative consequences, such as policies that boost fertilizer use while simultaneously degrading the water resources essential for agriculture [68]. Achieving coherence requires establishing formal inter-ministerial platforms and strengthening the regulatory

framework to ensure that policies are mutually supportive [130]. This involves integrating the principles of sustainable nutrient management into national agricultural strategies and ensuring that environmental considerations are factored into subsidy decisions from the outset [260]. Strengthening the capacity of institutions to manage these complex interactions is vital for steering the agricultural sector towards a truly sustainable path that balances productivity with environmental stewardship and social equity [67].

Strategic Roadmap for Reform and Alignment with Global Standards

To transform its fertilizer system from a legacy program plagued by inefficiency and inequity into a modern, sustainable, and effective instrument of agricultural policy, Bangladesh must embark on a coordinated and phased strategic roadmap. This roadmap should prioritize foundational digital infrastructure, accelerate the transition to a market-based subsidy delivery model, and strategically repurpose support to promote long-term sustainability. By doing so, the country can align its practices with contemporary global standards set by organizations like the World Bank, FAO, and OECD, moving beyond simple input provision towards fostering resilient and climate-smart food systems [123][215][246].

The first and most critical priority is to **accelerate the nationwide rollout of the Krishak Card/Farmer ID system**. This initiative is the non-negotiable foundation for all subsequent reforms. A comprehensive, biometrically verified national registry of farmers is essential for enabling accurate targeting, eliminating subsidy leakages, and creating a transparent and auditable trail for all transactions [43][115]. Without this digital identity layer, any attempts at implementing a voucher system or other targeted interventions will be hampered by uncertainty and fraud. The government's plan to issue 22 million cards by 2028 should be expedited, with dedicated resources allocated to ensure high enrollment rates and data quality across all regions [115].

Second, the government should **expand the e-voucher pilot program nationally and establish a competitive framework for private sector participation**. The positive early results from the potassium fertilizer pilot demonstrate the viability of this model [135]. Expanding this to cover a wider range of essential inputs and geographical areas will empower farmers with choice, foster competition among private dealers, and reduce the operational burdens and inefficiencies of the state-owned distribution monopoly [29].

Establishing clear, transparent, and merit-based criteria for licensing private companies to act as voucher redemption points will be crucial for building a robust and reliable private distribution network.

Third, Bangladesh must **implement a phased approach to subsidy repurposing**, beginning with tangible shifts in input composition and gradually incorporating incentive-based programs for sustainable practices. The initial step should be to redirect a portion of the subsidy budget from nitrogen-only fertilizers to balanced NPK blends, directly addressing the well-documented problem of soil nutrient imbalance [21] [129]. Concurrently, the government should introduce programs that provide incentives for farmers who adopt Best Management Practices (BMPs) and Climate-Smart Agriculture (CSA) techniques, such as precision application and conservation tillage [71] [129]. This dual approach tackles the immediate environmental damage while building a long-term culture of sustainable intensification.

Fourth, the government must **invest in modernizing the entire supply chain**. This involves developing a real-time Supply Chain Information Portal to provide end-to-end visibility of fertilizer procurement, warehousing, and distribution [321]. Such a portal would allow authorities to monitor stock levels, track shipments, and identify bottlenecks, thereby reducing delays and post-harvest losses [15]. Investment in physical logistics infrastructure, coupled with training for personnel in modern supply chain management, is also necessary to overcome the chronic connectivity and handling issues that plague the sector [133] [267].

Finally, to ensure the long-term success and legitimacy of these reforms, the government must **enhance its capacity for data collection, monitoring, and evaluation**. Rigorous, independent evaluations using advanced methodologies, such as those employed by the World Bank's DIME team, are needed to generate credible evidence on the impacts of the new e-voucher system on farmer income, productivity, and equity [20] [272]. Establishing clear, measurable indicators aligned with the new policy objectives will allow for continuous learning and adaptive management, ensuring that the program evolves to meet the changing needs of farmers and the environment [126] [256]. By pursuing these interconnected reforms in a deliberate and systematic manner, Bangladesh can forge a new path for its agricultural support system, one that enhances food security, promotes environmental sustainability, and improves the livelihoods of its farming communities in line with global best practices.
